Technology and Society: Pathway of Change

To achieve our long-term goal:

The internet and digital technologies are increasingly equitable; designed and governed to advance social and economic justice, particularly for those experiencing persistent discrimination.

We will:

Advance Equity in Technology Policy and the Internet

Empower Public Interest Technologists

Build Field Capacity and Infrastructure

Reimagine Just Technological Futures

With:

Support for advocacy, research, and organizing to advance justice and equity in technology policy and design.

Institutional and leadership support to expand a diverse field of public interest technologists and broader technology rights and justice field.

General support and capacity building for a more resilient, diverse, and effective field; Convening and networking support for the field to develop effective and collaborative agendas.

Investment in people and organizations developing new narratives and alternative pathways for technology design and implementation grounded in the values of social, political, and economic justice.

So that:

Key public and private actors establish and enforce laws, regulations, norms, and technical standards that advance more equitable, secure, and accessible digital technologies and infrastructure.

Government and civil society increasingly integrate and empower public interest technologists with diverse expertise and identities who can help embed equity into technology implementation.

A more resilient and coordinated technology rights and justice field is led by, and reflects the priorities of, communities most impacted by discriminatory uses of technology.

The technology rights and justice field advances transformative positive visions and demonstrable examples of a technology ecosystem and internet that expands social and economic justice.
